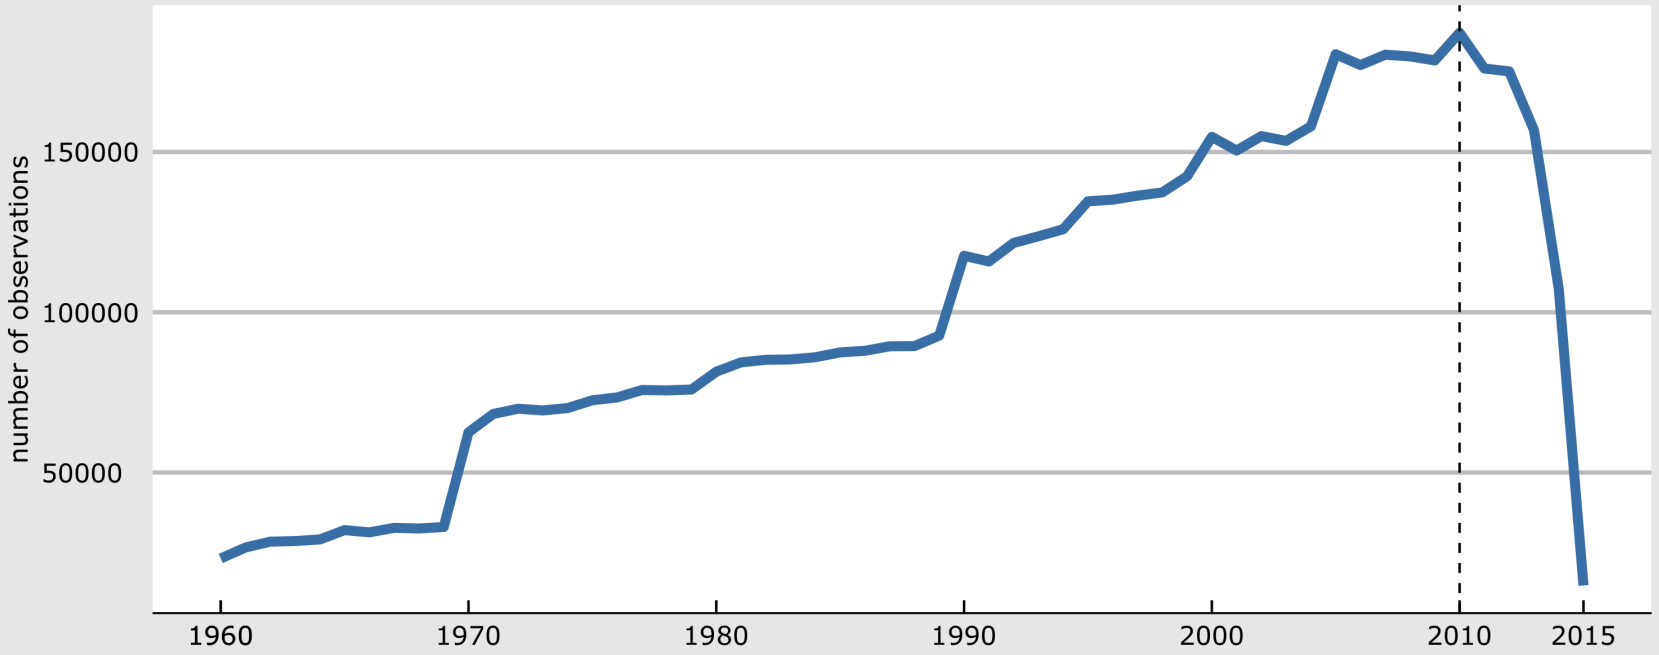
Looking at Indicators as a 3D matrix leads to some problems

- YEARS → not homogeneous
- COUNTRIES → small ones
- INDICATORS → too many to choose easily

Number of observations for each year

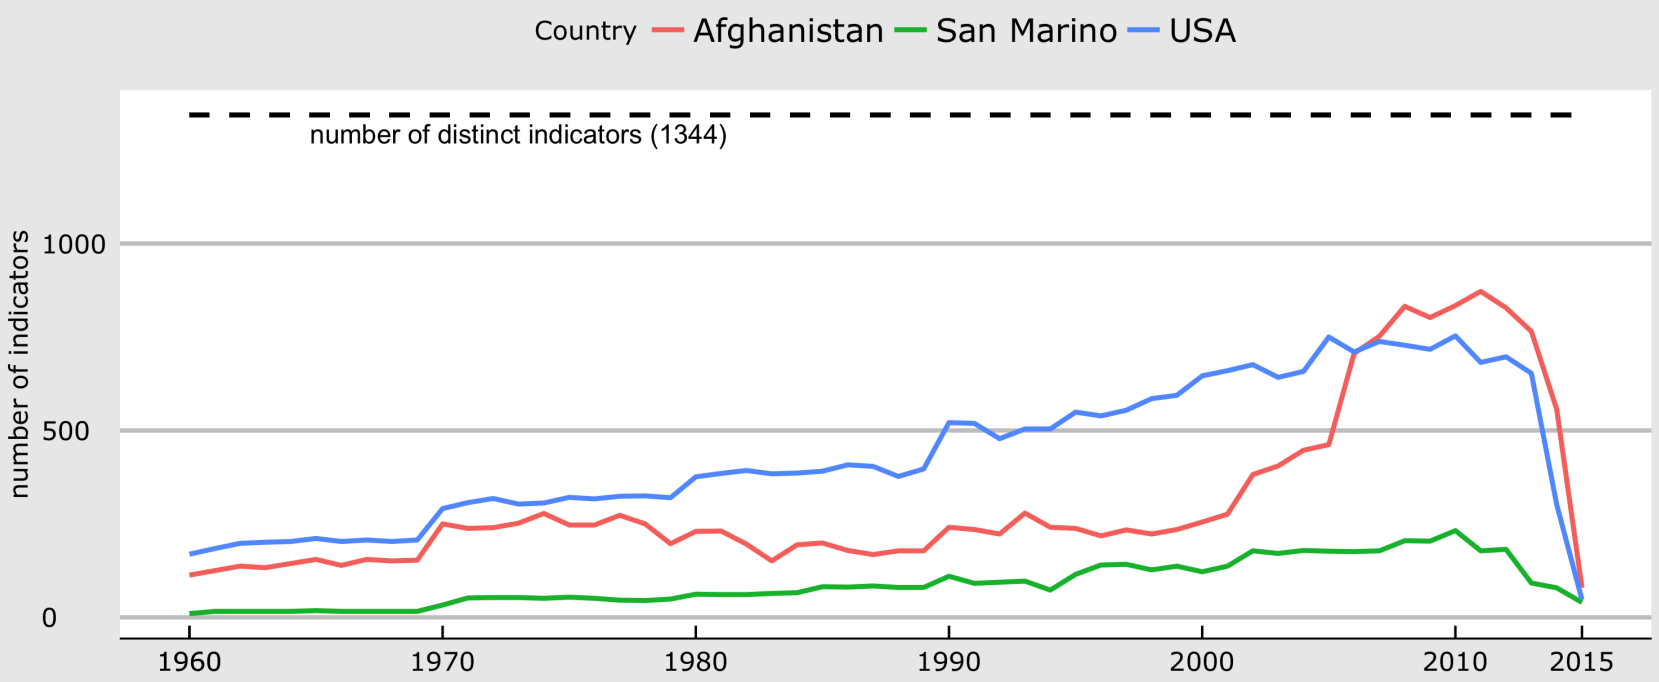
Increasing in the years, dropping in the very last due to the difficulty to find recent data



For each year, an indicator is counted multiple times if present for multiple countries

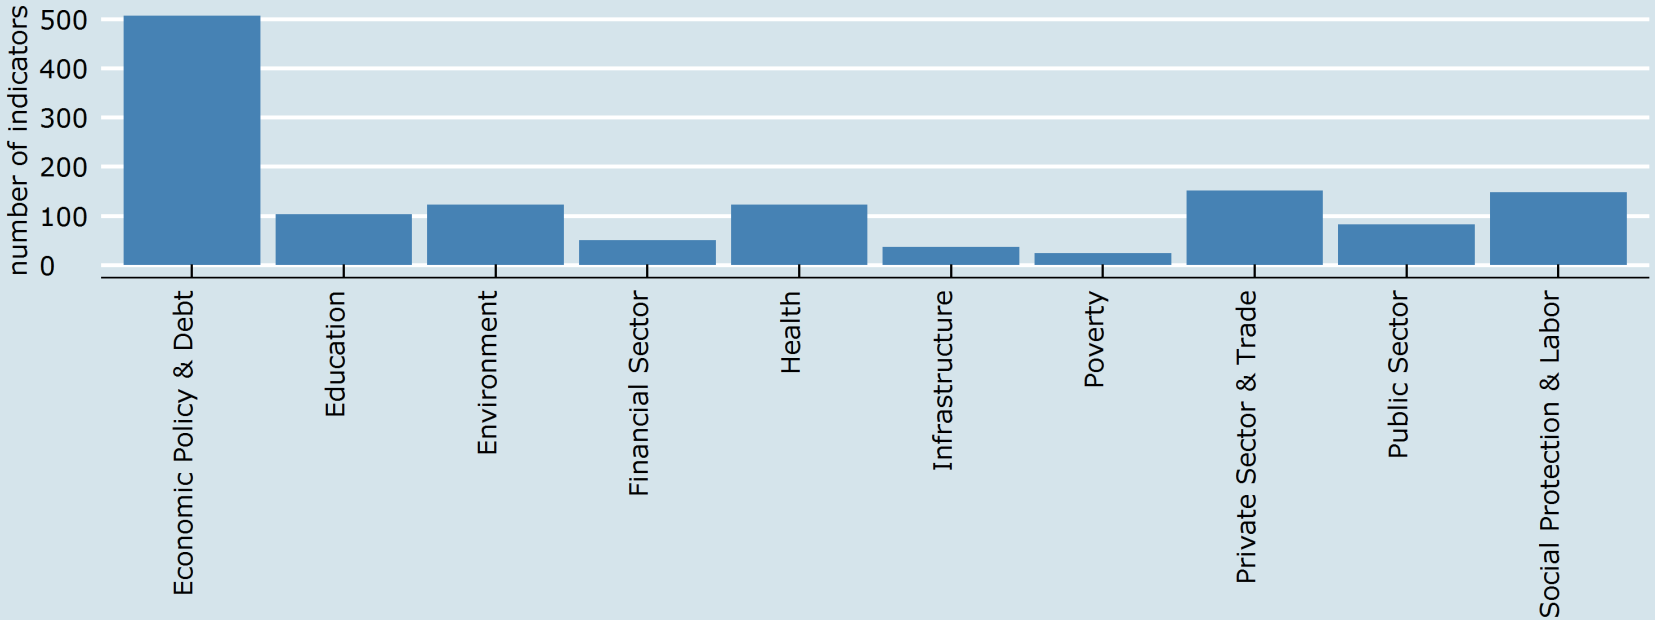
Number of indicators for some significative countries

USA are normal, San Marino is small, Afghanistan is problematic



Number of indicators for each supertopic

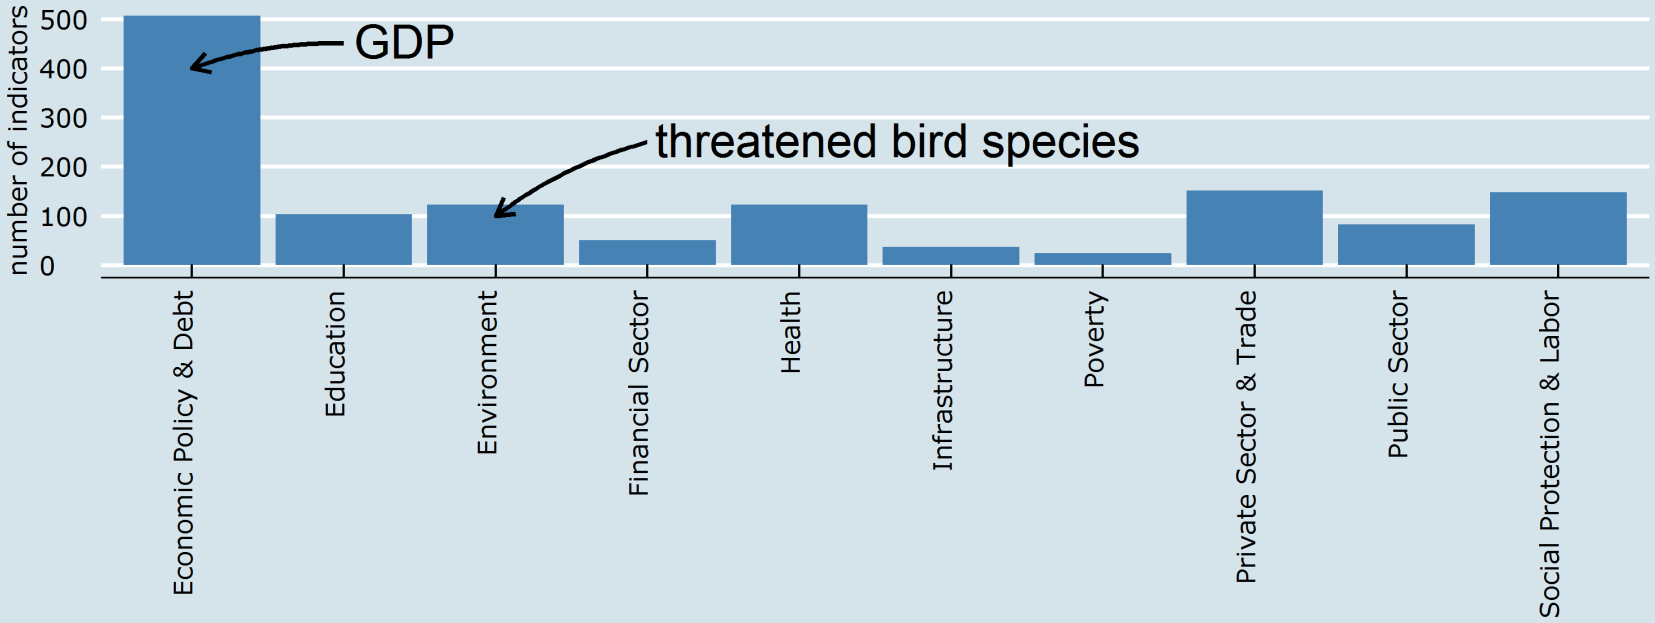
Prevalence of economic indicators: our field of analysis



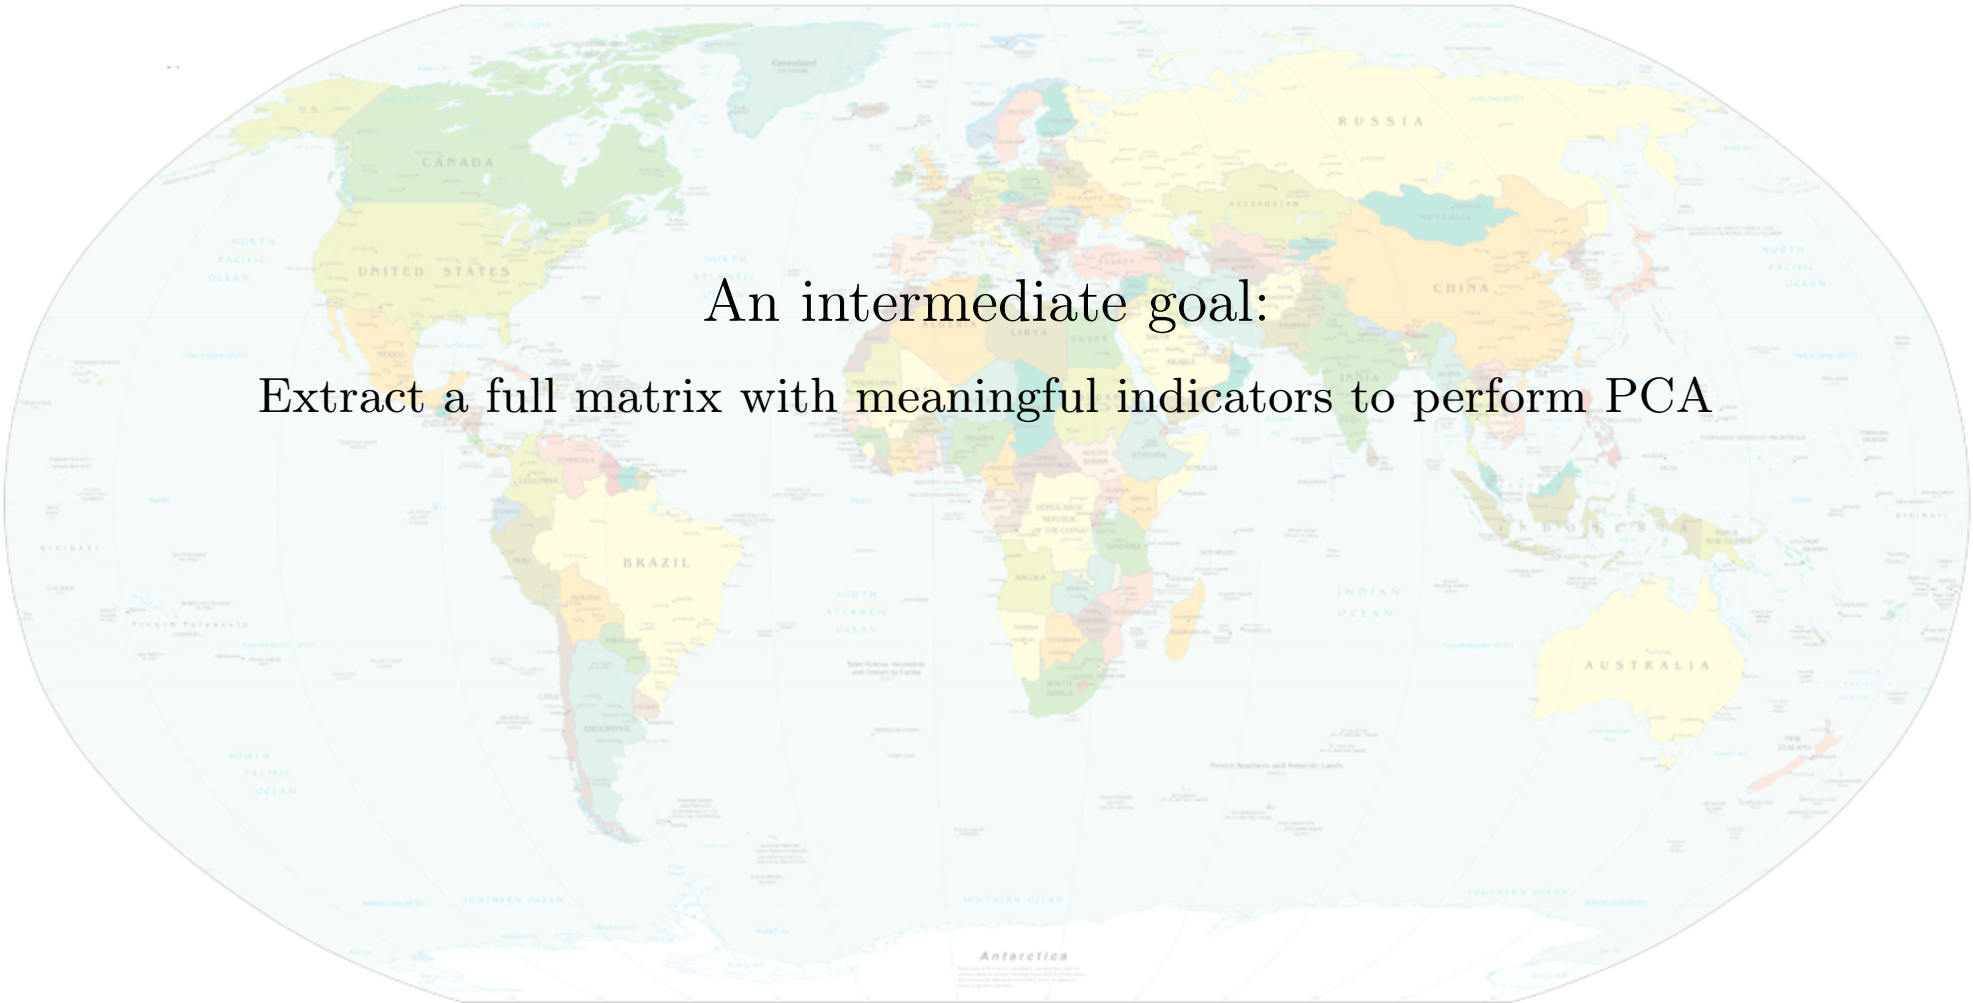
The supertopic is not present in the raw dataset but comes naturally from the topic.
(e.g. topic = Infrastructure: Transportation, supertopic = Infrastructure)

Number of indicators for each supertopic

Prevalence of economic indicators: our field of analysis



The supertopic is not present in the raw dataset but comes naturally from the topic.
(e.g. topic = Infrastructure: Transportation, supertopic = Infrastructure)

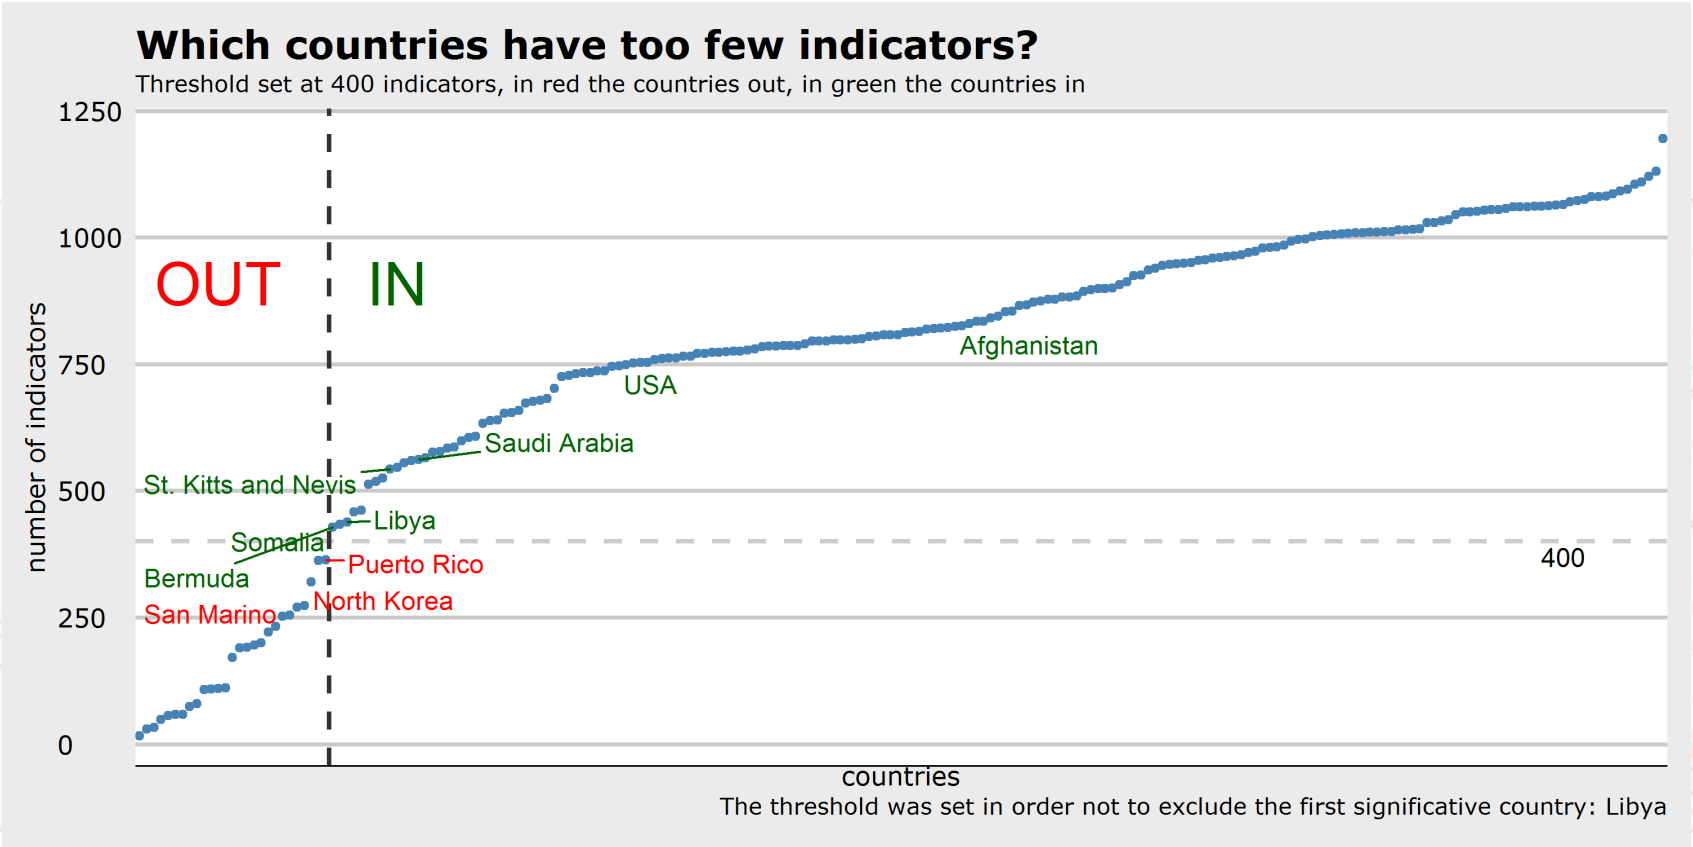


An intermediate goal:

Extract a full matrix with meaningful indicators to perform PCA

Fix the best year:

2010



Which countries have too few indicators?
Threshold set at 400 indicators, in red the countries out, in green the countries in
1250
1000
750
500

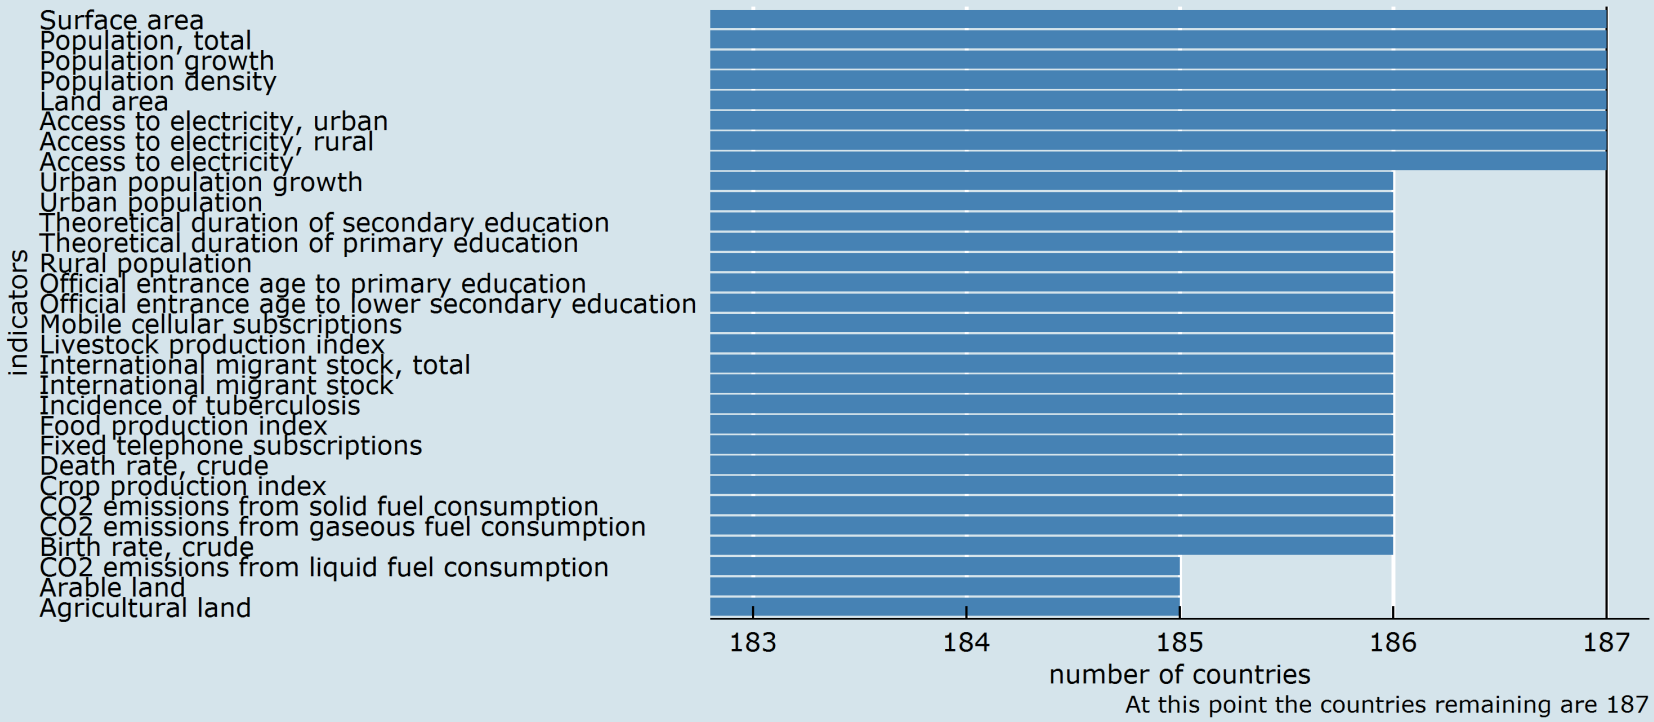
0
number of indicators
OUT
IN
Afghanistan
USA
Saudi Arabia
St. Kitts and Nevis
Libya
Somalia
Puerto Rico
Bermuda
North Korea
San Marino
400
countries
The threshold was set in order not to exclude the first significative country: Libya

The fullest indicators

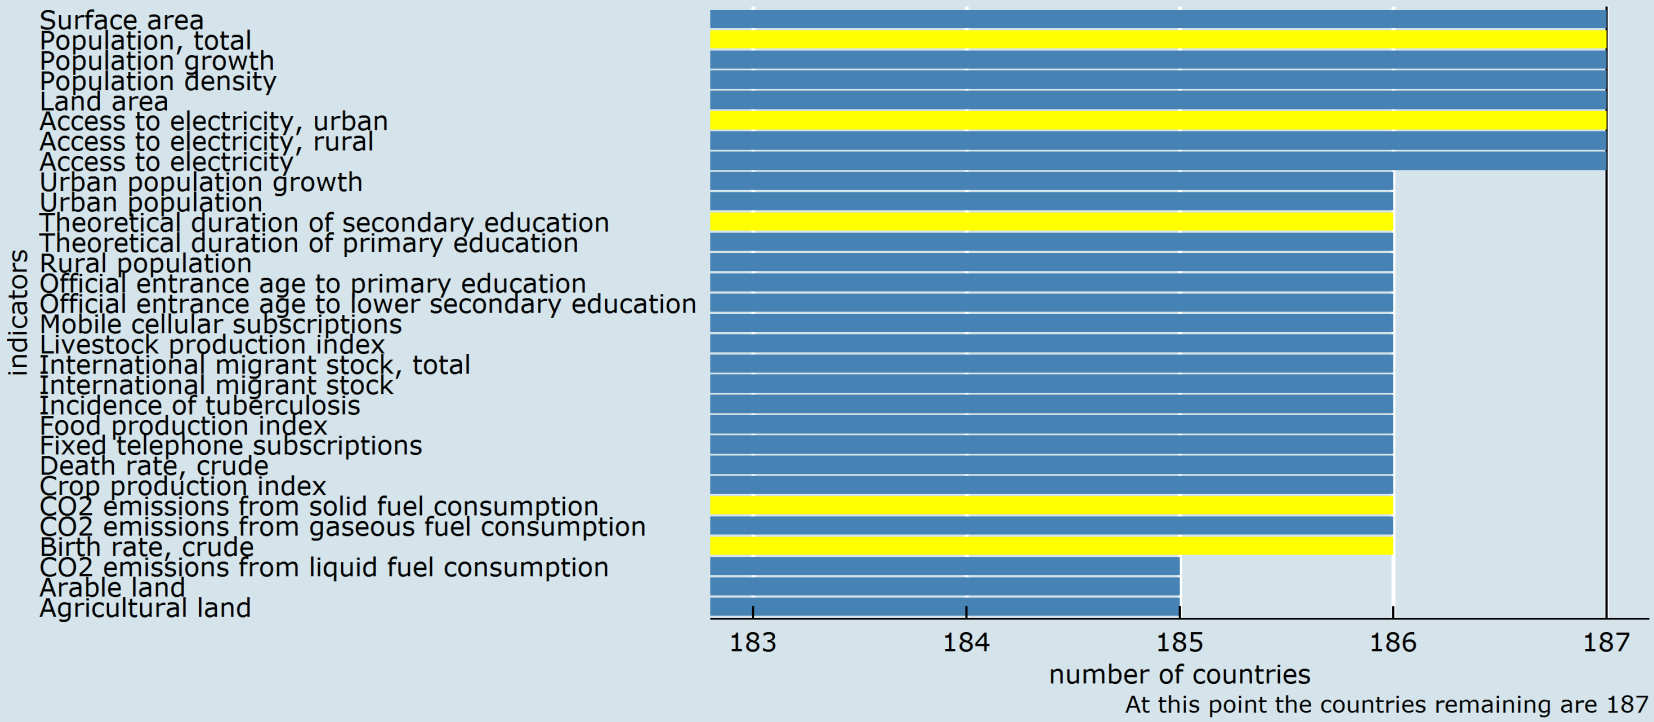
Look at the indicators manually and select the most significative



At this point the countries remaining are 187

The fullest indicators

Look at the indicators manually and select the most significative



At this point the countries remaining are 187
